                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a partial genomic sequence of a wheat starch branching enzyme, designated BEIID. BEILD is a type II starch branching enzyme (SBE). The BEIID nucleic acids may be used to genetically transform cereal plants such as wheat or barley and for altering their nutritional content by modulating the starch

The quality of starch is improved by the use of the protein.

The SBEII-1 genes are thought to have similar functional properties to the maize SBEIIb gene. Starch branching enzymes catalyse the formation of the alpha-1,6 linkages, creating branch points in the growing starch molecule, via hydrolysis of an alpha-1,4 linkage followed by reattachment of the released alpha-1,4-9 lucan chain to the same or another glucosyl chain. SBEII polypeptides can be used to alter the characteristics of a plant, in particular to alter starch so that it has an elevated gelatinisation onset and/or peak temperature. Starch obtained from transgenic plants is useful in the preparation or processing a foodstuff, particularly bakery products.

BEIID is a type II starch branching enzyme (SBE The BEIID nucleic acids may be used to genetically transform cere: plants such as wheat or barley and for altering their nutritional content by modulating the starch biosynthetic pathway to vary lev of amylopectin and/or amylose produced in the plant.

It was obtd. by site-specific mutagenesis of the SBEIIb gene in plasmid pBE240 to generate an NCOI site at the ATG start site, and EcoRI digestion of the mutagenised plasmid. The 2.09 kb fragment was inserted, in sense orientation, between the zein promoter and 3' regions in vector pMIO3 to produce pBE96. Co-suppression and antisense techniques can be used to inhibit SBEIIb in transgenic plants and thereby alter starch properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI;

It was generated by EccRI digestion of plasmid pBE240 and was inserted into vector pML103 in antisense orientation with respect to a maize 27 kba zein promoter and a 10 kba zein gene 3' sequence. Transgenic corn plants expressing the near full-length SBEIIb antisense transcript demonstrated a unique starch

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Producing non-glycogen-like polysaccharides in bacteria, fungi plants - transformed with genes for enzymes involved in starch glycogen synthesis allows fermentative production of starches we engineered properties
                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                        new starches in plants. These stanon-food applications of starch. the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The specification describes a method for the production of non-glycogen-like polysaccharides in a host. The method comprises transforming a host, suitable for fermentation, with genes encoding starch- or glycogen-synthesis enzymes, and fermenting the transformant starch- or glycogen synthesis enzymes, and fermenting the transformant starch- or glycogen synthesis enzymes, and fermenting the transformant starch- or glycogen synthesis enzymes, and fermenting the transformation also describes hosts transformed with a gene active
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Disclosure; Fig 53; 150pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                  in glycogen synthesis and at least one non-starch branching gene, involved in production of amylopectin or amylose in its original host. The method is used to produce plant-like starches by fermentation and new starches in plants. These starches are useful for all food and non-food applications of starch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       рЬ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                               A cDNA insert (AAT69729) in plasmid clone pBE240 comprises a EcoRI-XhoI fragment isolated from a corn cDNA library. It in an open reading frame encoding starch branching enzyme IIb (S (AAW19212). The insert was used as a starting point in the a of DNA constructs (see also AAT69730, AAT69736-37) designed the achieve suppression of SBEIIb expression in transgenic corn pand thereby to produce novel starches that have properties beneficial in food and industrial applications.
                                                                                                                                                                                                                                                                                                             Transgenic corn in which grain derived starch fine structure is controlled - specifically branch chain distribution of amylopectin, useful in preparation of thickened foodstuff
                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI;

The hybrid polypeptide can be used to make modified starches comprising the payload protein, selected from, e.g. hormones, growth factors, antibodies, enzymes, dyes, immunoglobulins, etc. The modified starch can also be used to provide grain feeds enriched in amino acids. By encapsulating the payload protein in starch, it is more resistant to degradation by stomach acids.

The starch content of rice grains can be increased by increasing the expression of branching enzyme in rice plants.

It was isolated from cassava tubers. The products can be used for producing plants having altered starch quantities and qualities. They can also be used for producing altered plants such as cassava, banana, potato, pea, tomato, maize, wheat, barley, oat, sweet potato and rice plants.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                     Site_2: EcoRI; Library was prepared by Statagene using the Uni-ZAP XR system (Stratagene BN937328-12). Clones were picked by a O-bot after blue/white selection (ampicillin resistance - use 100 micrograms/microliter). Developed from a pool of equal amounts of RNA from developing embryos sampled at 14, 21, 28 and 35 days after pollination of the Illnois High Oil Maize Strain Cycle 90. This closed strain has been selected for high oil concentration for 90 generations and originates from the 1890s era open pollinated variety Burr's White"
